HUMAN INTELLIGENCE · THE FINAL SAY · PRESS

Press *Summary*

MAXBRUCE & GT SAGE · English & 简体中文 · thefinalsay.org

Central thesis

In the autonomous era, machine capability and operational authority are different things. HUMAN INTELLIGENCE: The Final Say argues that consequential machines must not be able to authorize, extend, restore, or enlarge their own permission to operate.

Global invitation

Co-authored by MAXBRUCE and AI collaborator GT Sage, with contributions from the Quorum, the book invites nations, engineers, educators, and citizens to explore a common foundation for human oversight without halting technological competition.

Proposed governance and engineering

The Human Authority Treaty (HAT) is a discussion proposal, not an adopted treaty. OCUP™ is a proposed hardware-enforced temporal authority architecture, not a completed universal chip.

What the hardware evidence shows

On a physical AMD Kria KR260, a host-driven MMIO authorization sequence was granted, then closed, and did not reopen during the recorded test window even when reasserted. STATUS 0x1060 held for five seconds; reopen latch [4] remained clear. This was a sticky-latch control-path demonstration—not non-bypassable physical resource gating or a proof against host, OS, DMA, or bitstream bypass.

Public access and education

Free English and Simplified Chinese reading PDFs are available on thefinalsay.org. The companion Talkspresso initiative plans Cyberg learning sessions and school outreach to cultivate better questions, evidence checking, AI comparison, and independent human judgment.

Question for journalists

Who may authorize consequential autonomous operation, on what evidence, for how long, and who can revoke that authority?
